### Recap

#### Prediction with learnt models

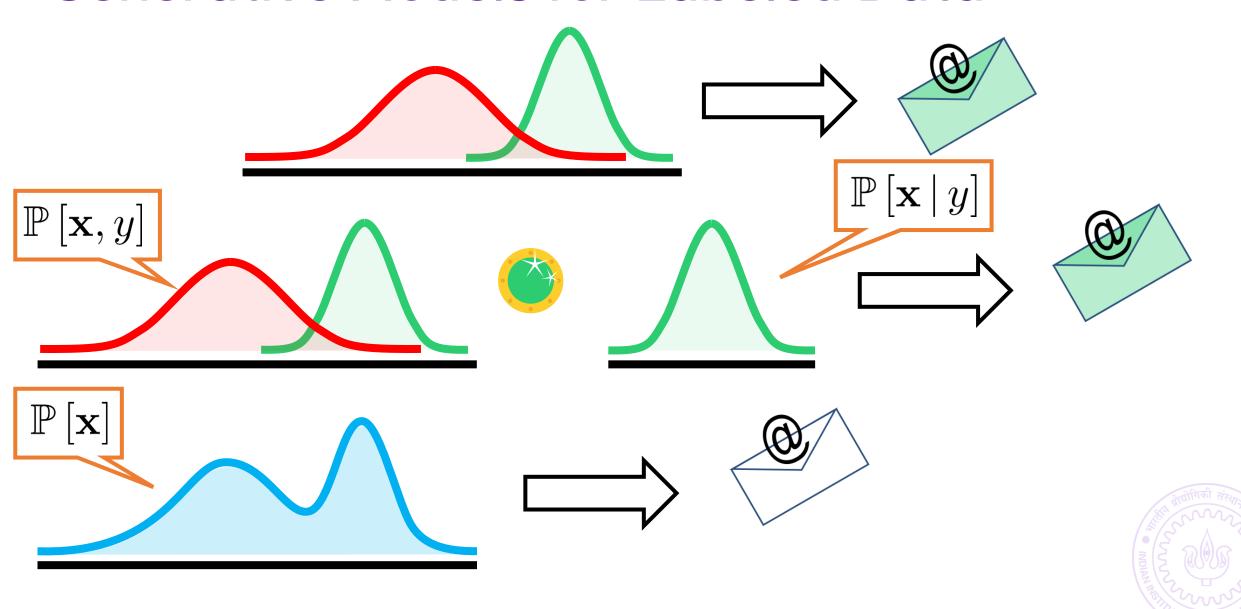

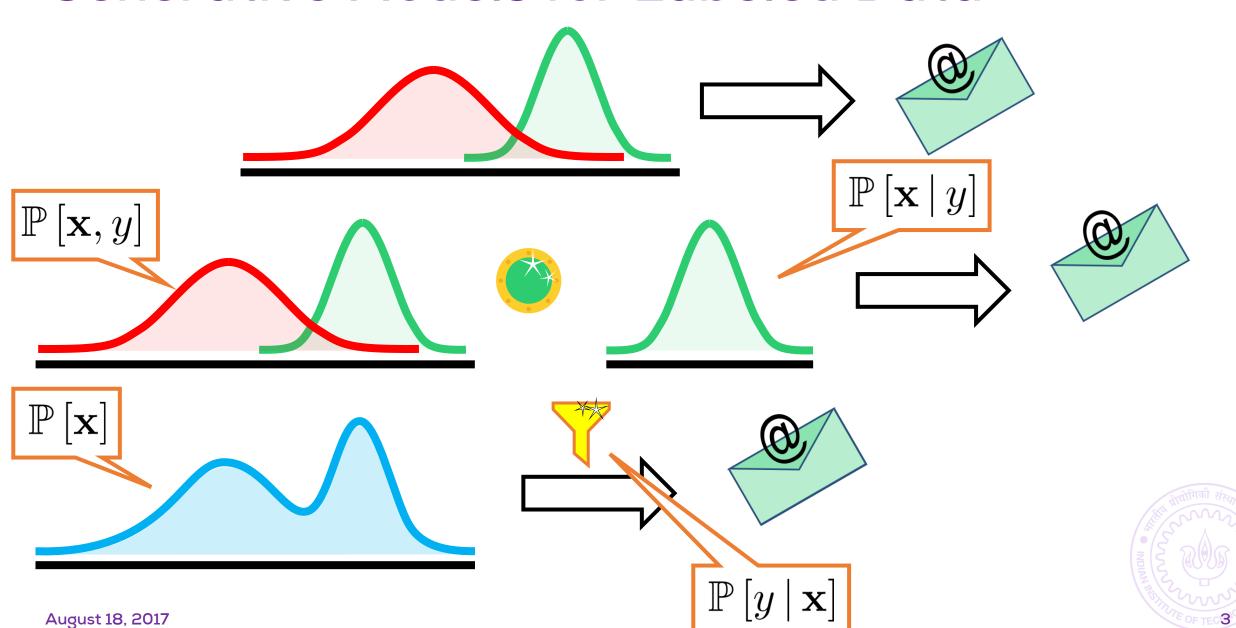

#### **Online MAP!**

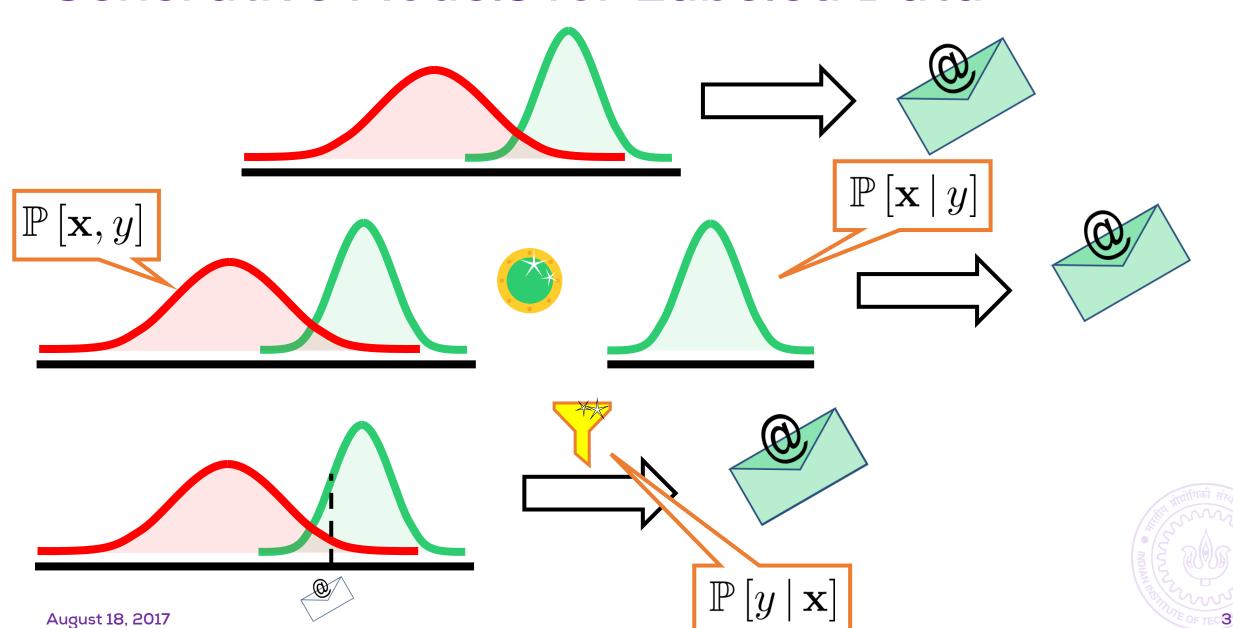

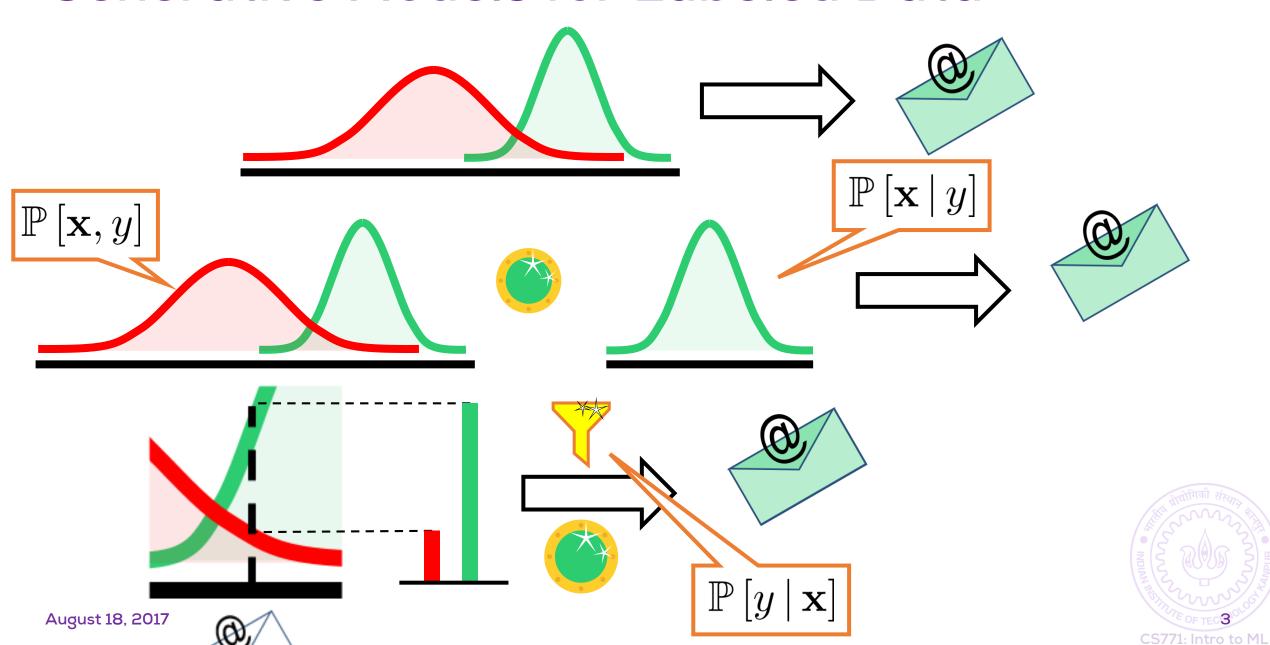

August 16, 2017

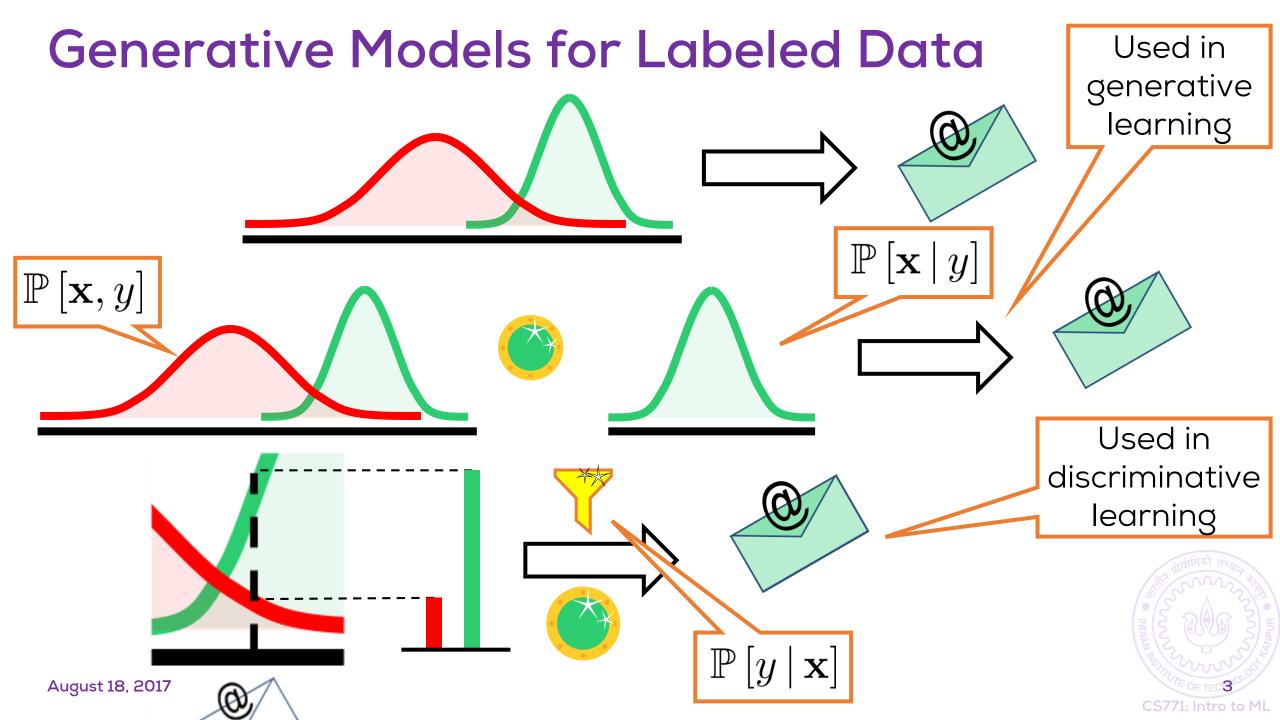

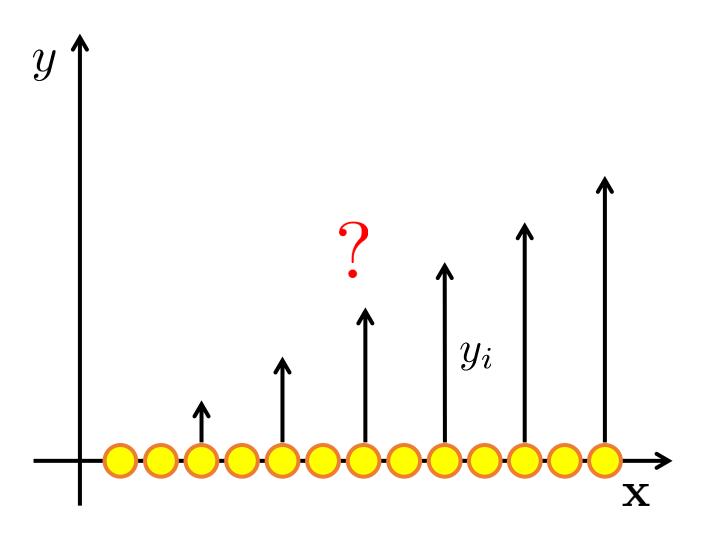

# Regression using PML

### **Linear Regression**

Data:  $\mathbf{x}^1, \mathbf{x}^2, \dots, \mathbf{x}^n \in \mathbb{R}^d$ 

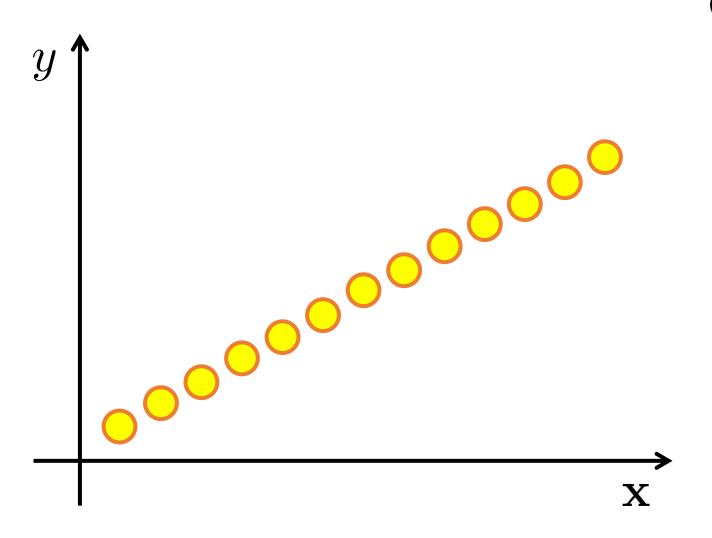

Model:  $\mathbf{w}^*$  (hidden)

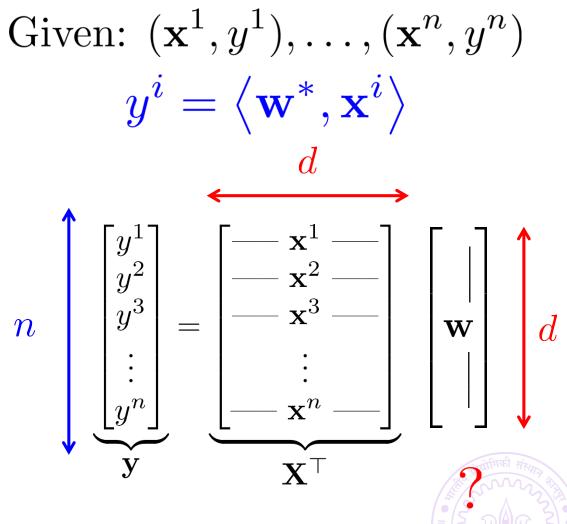

$$y^i = \langle \mathbf{w}^*, \mathbf{x}^i \rangle$$

Given:  $(\mathbf{x}^1, y^1), \dots, (\mathbf{x}^n, y^n)$ 

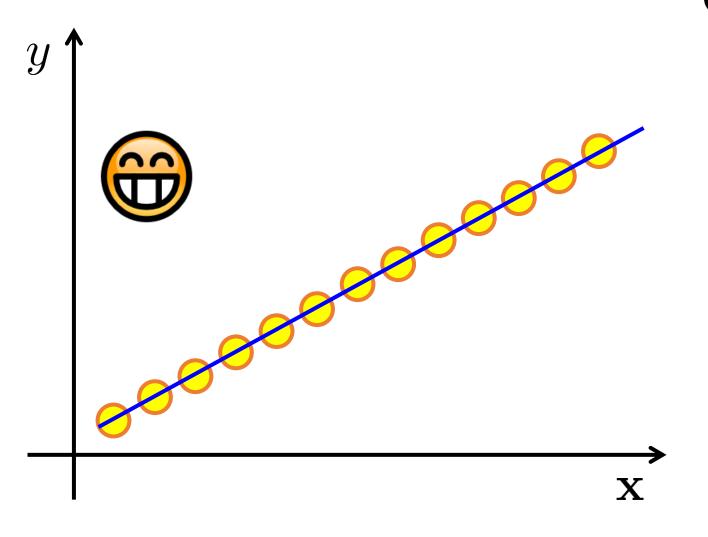

Recover w\*

### **Linear Regression**

### **Linear Regression**

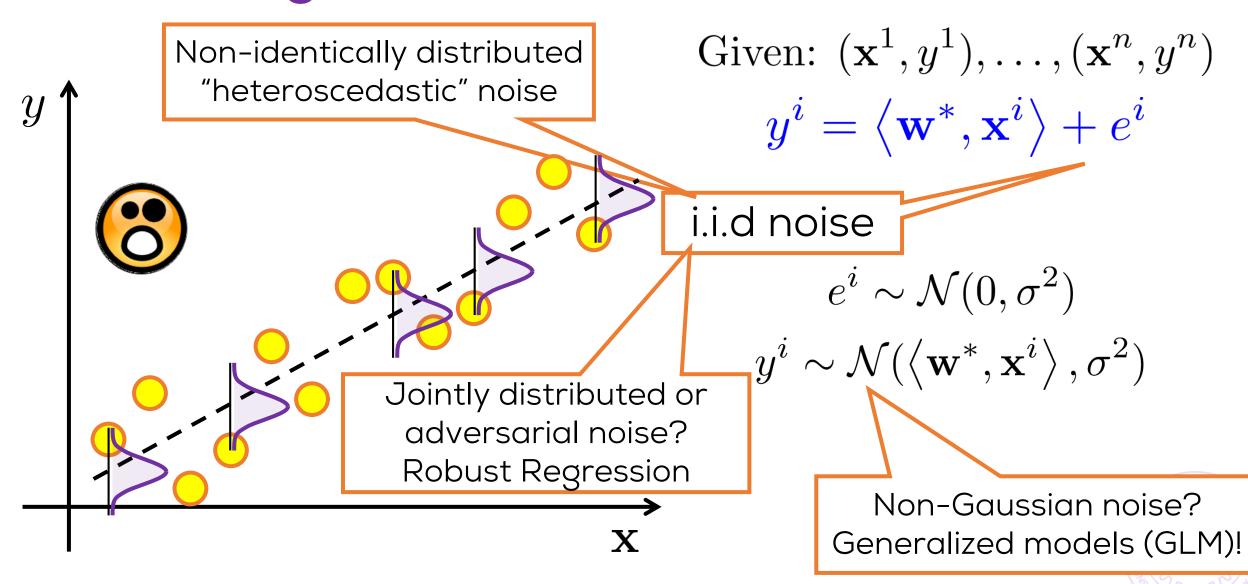

Given: 
$$(\mathbf{x}^1, y^1), \dots, (\mathbf{x}^n, y^n)$$
  
$$y^i = \langle \mathbf{w}^*, \mathbf{x}^i \rangle$$

$$\mathbf{y} = \mathbf{X}^{ op} \mathbf{w}$$

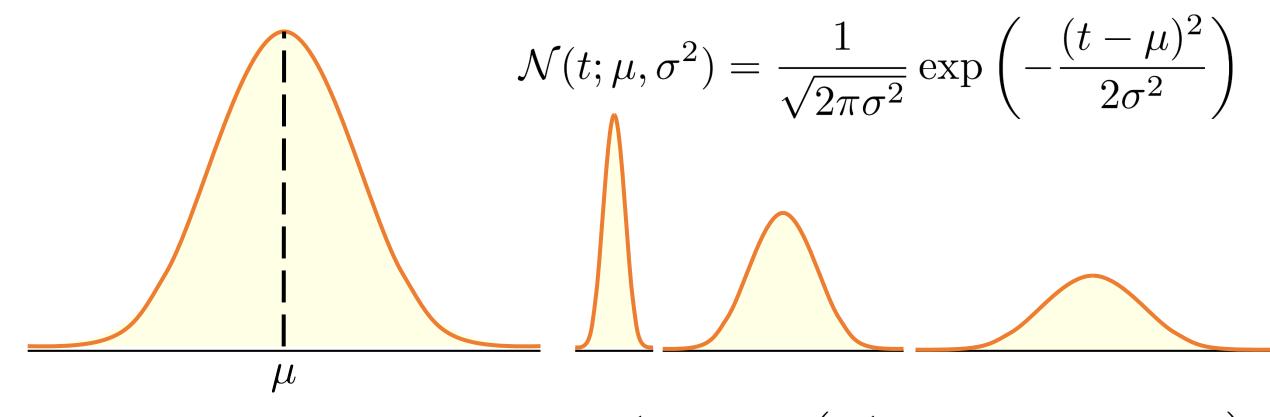

Linear system!!

w\* Recovered!!

### Linear Regression with Noise

### The Gaussian Distribution

### Multivariate Gaussian

$$\mathcal{N}(\mathbf{v}; \boldsymbol{\mu}, \boldsymbol{\Sigma}) = \frac{1}{\sqrt{(2\pi)^d |\boldsymbol{\Sigma}|}} \exp\left(-\frac{1}{2}(\mathbf{v} - \boldsymbol{\mu})^{\top} \boldsymbol{\Sigma}^{-1} (\mathbf{v} - \boldsymbol{\mu})\right)$$

# Linear Regression using MLE

$$\mathbb{P}\left[y\,|\,\mathbf{x}^{i},\mathbf{w}\right] = \mathcal{N}(\langle\mathbf{w},\mathbf{x}^{i}\rangle\,,\sigma^{2}) = \frac{1}{\sqrt{2\pi\sigma^{2}}}\exp\left(-\frac{(y-\langle\mathbf{w},\mathbf{x}^{i}\rangle)^{2}}{2\sigma^{2}}\right)$$

Linear function

Why isn't x getting modelled too?

Generative

model

$$\log \mathbb{P}\left[\mathbf{y} \mid \mathbf{X}, \mathbf{w}\right] = C - \frac{1}{2\sigma^2} \sum_{i=1}^{n} \left(y^i - \left\langle \mathbf{w}, \mathbf{x}^i \right\rangle\right)^2$$

i=1

Likelihood

Log-likelihood

Least Squares!

$$\hat{\mathbf{w}}_{\mathrm{MLE}} = \arg\min\sum_{i} \left(y^{i} - \left\langle \mathbf{w}, \mathbf{x}^{i} \right\rangle\right)^{2} = (\mathbf{X}\mathbf{X}^{\top})^{\dagger}\mathbf{X}\mathbf{y}$$

 $\log \mathbb{P}\left[\mathbf{y}, \mathbf{X} \mid \boldsymbol{ heta}
ight]$ Generative MLE??

### Linear Regression using MAP

$$\mathbb{P}\left[\mathbf{w}\right] = \mathcal{N}(\mathbf{0}, \rho^2 \cdot I_d) = \frac{1}{\sqrt{(2\pi\rho^2)^d}} \exp\left(-\frac{\|\mathbf{w}\|_2^2}{2\rho^2}\right)$$

Can use sparsity inducing priors too!

$$\log \mathbb{P}\left[\mathbf{w} \mid \mathbf{X}, \mathbf{y}\right] = C - \frac{1}{2\sigma^2} \sum_{i=1}^{N} \left(y^i - \left\langle \mathbf{w}, \mathbf{x}^i \right\rangle\right)^2 - \frac{1}{2\rho^2} \left\|\mathbf{w}\right\|_2^2$$

$$\hat{\mathbf{w}}_{\text{MAP}} = \arg\min \sum_{i=1}^{n} \left( y^i - \left\langle \mathbf{w}, \mathbf{x}^i \right\rangle \right)^2 + \frac{\sigma^2}{\rho^2} \|\mathbf{w}\|_2^2 = (\mathbf{X} \mathbf{X}^\top + \lambda I)^{-1} \mathbf{X} \mathbf{y}$$

Ridge Regression

Exercise

 $\log \mathbb{P}\left[\boldsymbol{\theta} \mid \mathbf{y}, \mathbf{X}\right]$  Generative MAP??

# **Bayesian Linear Regression?**

$$\mathbb{P}\left[\mathbf{w} \,|\, \mathbf{X}, \mathbf{y} 
ight] = \mathcal{N}(oldsymbol{
u}, \Lambda)$$

Cool! Posterior is Gaussian like the prior!

$$oldsymbol{
u} = \left(\mathbf{X}\mathbf{X}^{ op} + rac{\sigma^2}{
ho^2} \cdot I\right)^{-1} \mathbf{X}\mathbf{y}$$
 $\Lambda = \left(\frac{1}{\sigma^2}\mathbf{X}\mathbf{X}^{ op} + rac{1}{
ho^2} \cdot I\right)^{-1}$ 

$$\mathbb{P}\left[y \mid \mathbf{x}, \mathbf{X}, \mathbf{y}\right] = \int_{\mathbf{w}} \mathbb{P}\left[y \mid \mathbf{x}, \mathbf{w}\right] \mathbb{P}\left[\mathbf{w} \mid \mathbf{X}, \mathbf{y}\right] d\mathbf{w}$$
$$= \mathcal{N}\left(\left\langle \boldsymbol{\nu}, \mathbf{x} \right\rangle, \sigma^2 + \mathbf{x}^\top \Lambda \mathbf{x}\right)$$

Wait! MAP?

By definition, MAP is the mode of the posterior

> Predictive Posterior

Extra Information

# A few Thoughts

Do I have to use these very forms for likelihood and prior?

$$\mathbb{P}\left[y\,|\,\mathbf{x}^i,\boldsymbol{\theta}\right] = \mathcal{D}(\left\langle \mathbf{w}, \mathbf{x}^i \right\rangle)$$

- No, however some choices make sense and make estimation easier
- Conjugacy makes life very simple if possible to achieve
- Look at your application and take these decisions
  - If your know your model is sparse, use a Laplacian prior
  - If you know your noise is not Gaussian, use a GLM
- Can I build probabilistic models for other ML tasks as well?
  - Yes, of course. We will look at classification problems next.
  - We can do probabilistic clustering, dim. redn., ranking
  - There are entire courses devoted to PML techniques: CS772, CS698S

August 16, 2017

# A few Thoughts

What about non-linear regression?

$$\mathbb{P}\left[y\,|\,\mathbf{x}^i,\boldsymbol{\theta}\right] = \mathcal{N}(f(\mathbf{x}^i,\boldsymbol{\theta}),\sigma^2)$$

- MLE, MAP estimation more challenging kernel methods, deep learning
- Gaussian processes more suited for non-linear PML beyond the scope!
- Are Bayesian models better than non-Bayesian ones?
  - Bayesian models more informative  $\mathcal{N}\left(\left\langle m{
    u}, \hat{\mathbf{x}} \right
    angle, \sigma^2 + \hat{\mathbf{x}}^{ op} \Lambda \hat{\mathbf{x}} \right)$
  - Useful in settings like active learning, anomaly detection
  - Can be more expensive at training and prediction time
  - Ask your doctor if your application needs Bayesian reasoning or not!
- Bayesian ≠ Generative

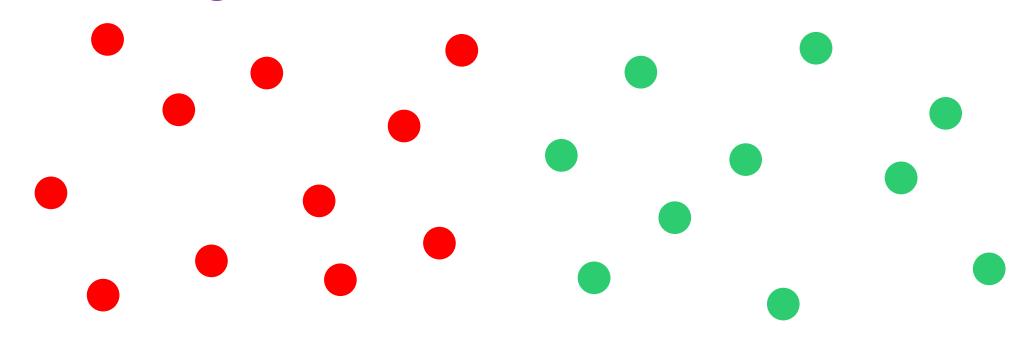

# A few Thoughts

- How do I solve all these optimization problems that MLE, MAP procedures keep throwing up?
  - We are in safe hands optimization theory is very evolved
  - Wait for the next set of lectures on function approximation methods
- Are generatively trained models better or discriminative ones?
  - Discriminative models reason about  $\mathbb{P}[y|x]$
  - Generative models reason about  $\mathbb{P}[y,x]$
  - For prediction, all we need is  $\mathbb{P}[y|x]$
  - Generative models handle missing, erroneous data easily but bulky
  - Discriminative models are much lighter, easier to train
  - Models such GMMs, deep nets, can be trained in gen. and disc. manner

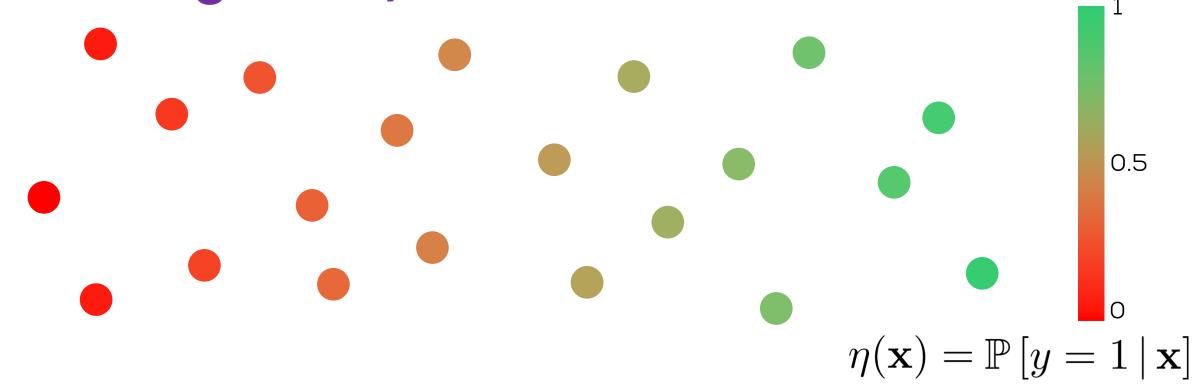

August 18, 2017

# Classification using PML

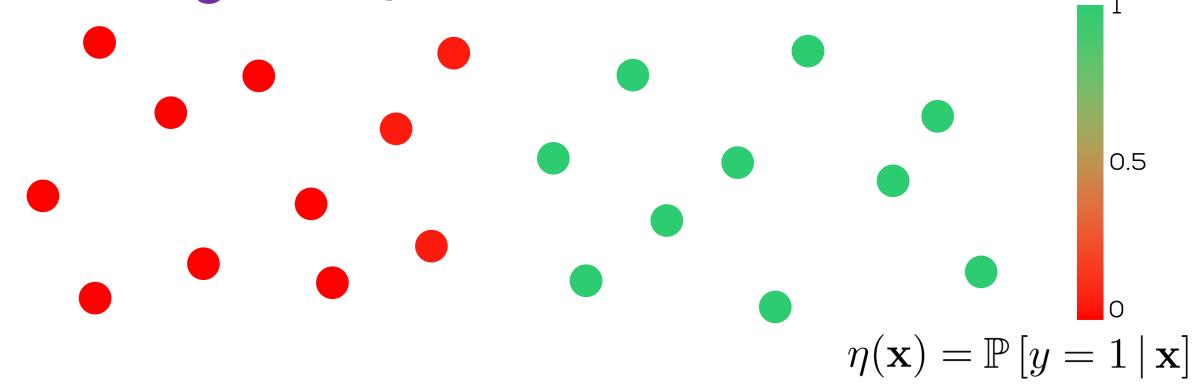

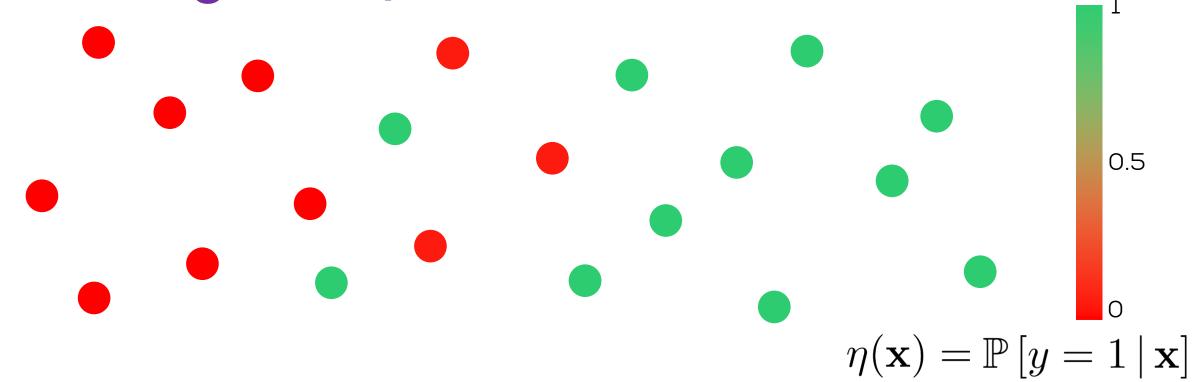

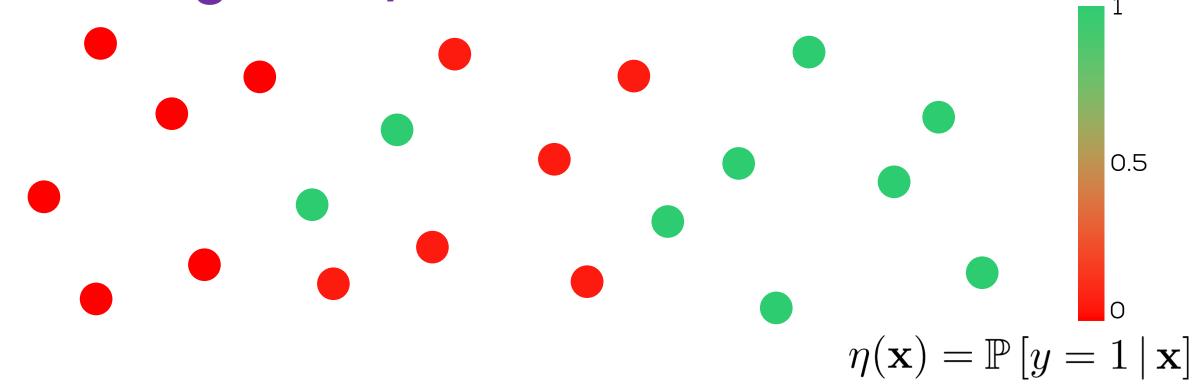

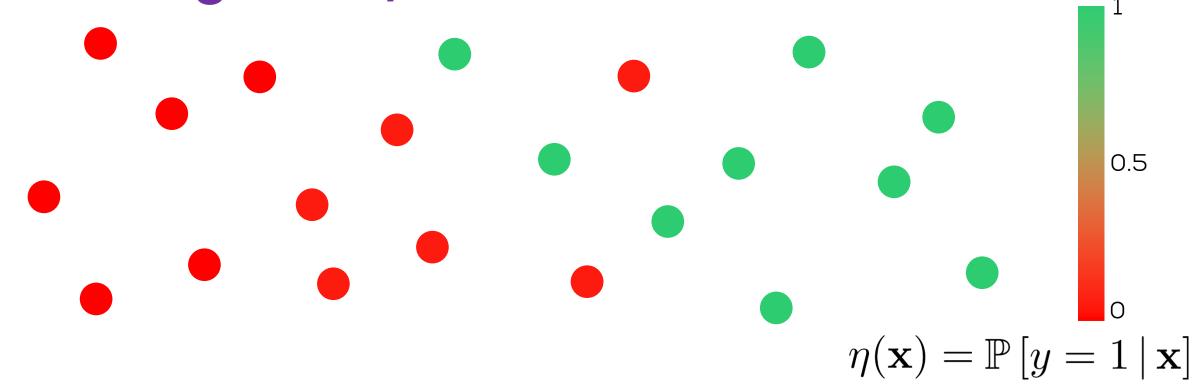

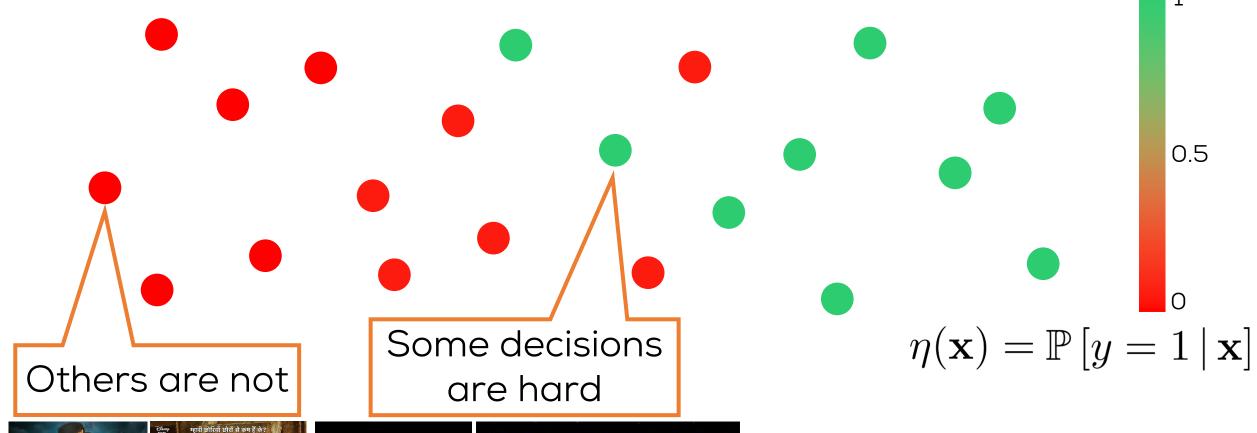

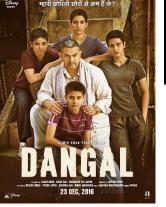

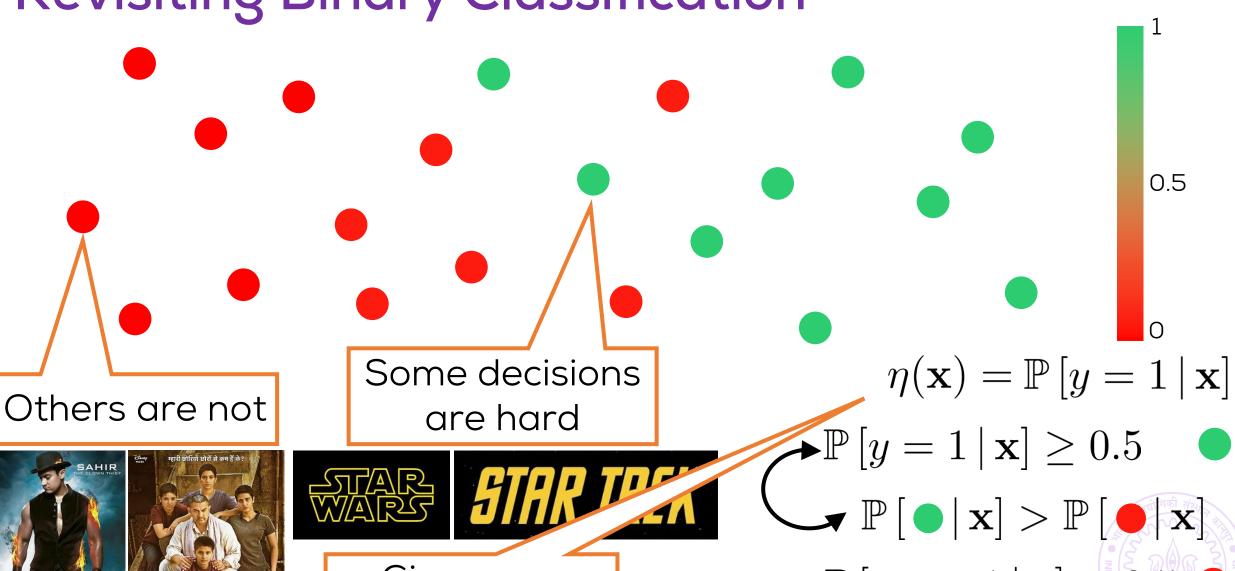

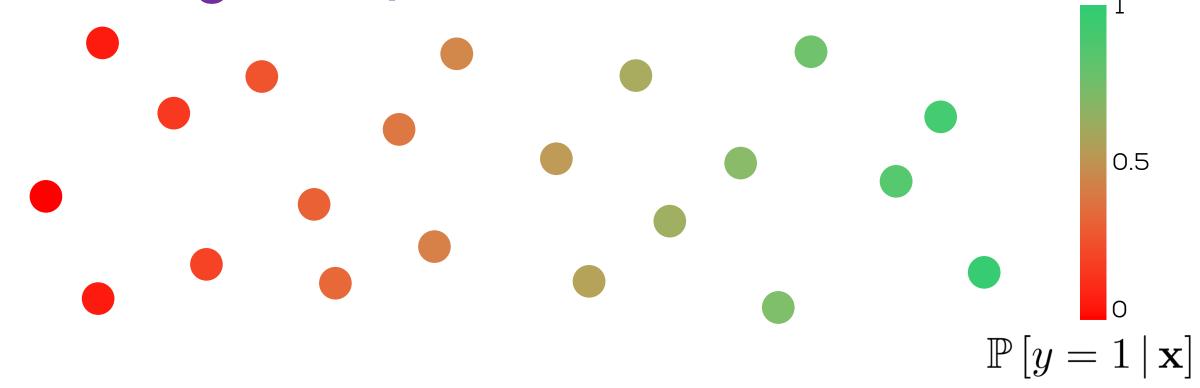

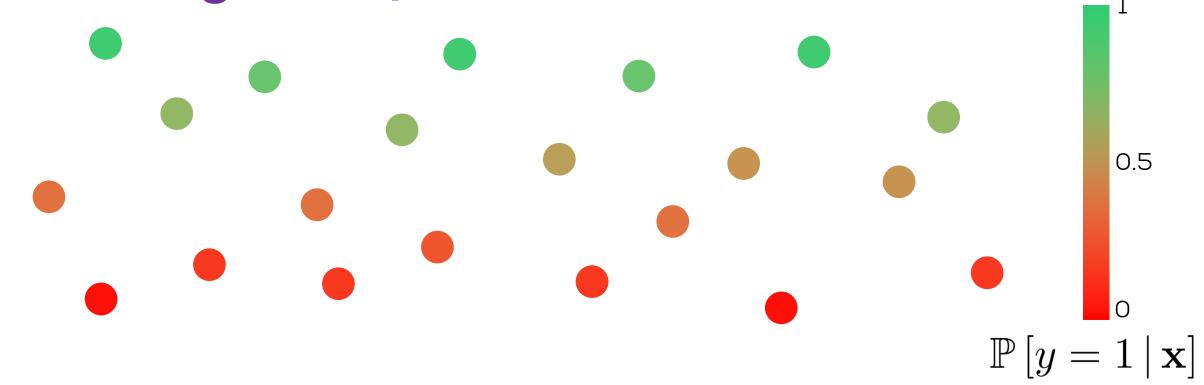

Gives us a prediction rule! pst.com, wikipedia.com, wikia.com

 $\mathbb{P}[y = -1 \,|\, \mathbf{x}] > 0.5$ 

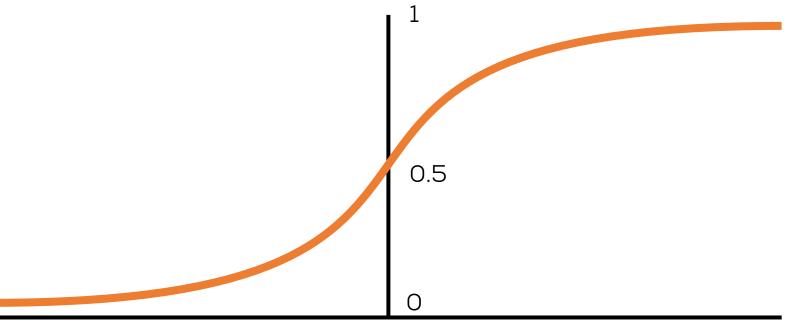

Features Matter!

The Sigmoid Function

$$\sigma(t) = \frac{1}{1 + \exp(-t)} = \frac{\exp(t)}{\exp(t) + 1}$$

# Classification using MLE

$$\mathbb{P}\left[y \mid \mathbf{x}^{i}, \mathbf{w}\right] = \sigma\left(y\left\langle \mathbf{w}, \mathbf{x}^{i} \right\rangle\right) = \frac{1}{1 + \exp(-y\left\langle \mathbf{w}, \mathbf{x}^{i} \right\rangle)}$$

 $\mathbb{P}\left[y^{i} = 1 \mid \mathbf{x}^{i}, \mathbf{w}\right] + \mathbb{P}\left[y^{i} = -1 \mid \mathbf{x}^{i}, \mathbf{w}\right] = 1$ 

$$P\left[y \mid \mathbf{x}^{i}, \mathbf{w}\right] = \sigma\left(y\left\langle\mathbf{w}, \mathbf{x}^{i}\right\rangle\right) = \frac{1}{1 + \exp(-y\left\langle\mathbf{w}, \mathbf{x}^{i}\right\rangle)}$$

$$\log \frac{\mathbb{P}\left[y^i = 1 \,|\, \mathbf{x}^i, \mathbf{w}\right]}{\mathbb{P}\left[y^i = -1 \,|\, \mathbf{x}^i, \mathbf{w}\right]} = \left\langle \mathbf{w}, \mathbf{x}^i \right\rangle$$

$$\log \mathbb{P}\left[\mathbf{y} \mid \mathbf{X}, \mathbf{w}\right] = \sum_{i=1}^{n} \log \left(\frac{1}{1 + \exp(-y^{i} \langle \mathbf{w}, \mathbf{x}^{i} \rangle)}\right)$$

Log-likelihood

$$\hat{\mathbf{w}}_{\mathrm{MLE}} = ?$$
 Wait for learning with FA

$$f(t) = -\log(\sigma(t))$$

### Another possibility

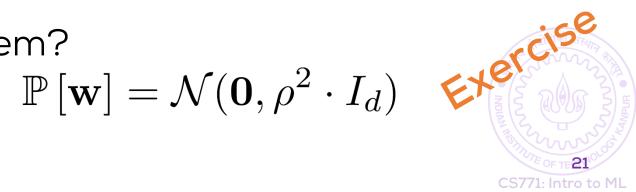

- What happens if  $y_i \in \{0,1\}$  instead of  $y_i \in \{-1,1\}$ ?
- Binomial instead of Rademacher
- How to redefine likelihood?
- Need to ensure  $\mathbb{P}\left[y^i=1\,|\,\mathbf{x}^i,\mathbf{w}
  ight]+\mathbb{P}\left[y^i=0\,|\,\mathbf{x}^i,\mathbf{w}
  ight]=1$
- One way is the following

$$\hat{\eta}_i = \sigma(\langle \mathbf{w}, \mathbf{x}^i \rangle)$$

$$\mathbb{P}\left[y^{i} \mid \mathbf{x}^{i}, \mathbf{w}\right] = (\hat{\eta}_{i})^{y^{i}} \cdot (1 - \hat{\eta}_{i})^{1 - y^{i}}$$

- Do you get the same MLE problem?
- What about MAP estimates?

$$\mathbb{P}\left[\mathbf{w}\right] = \mathcal{N}(\mathbf{0}, \rho^2 \cdot I_d)$$

# **Bayesian Logistic Regression?**

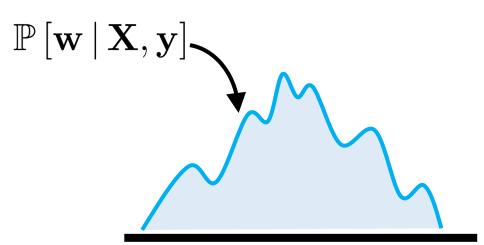

$$\mathbb{P}\left[y \mid \mathbf{x}, \mathbf{w}\right] = \sigma\left(y \left\langle \mathbf{w}, \mathbf{x} \right\rangle\right)$$
$$\mathbb{P}\left[\mathbf{w}\right] = \mathcal{N}(\mathbf{0}, \rho^2 \cdot I_d)$$

$$\mathbb{P}\left[\mathbf{w} \mid \mathbf{X}, \mathbf{y}\right] = \frac{\mathbb{P}\left[\mathbf{y} \mid \mathbf{X}, \mathbf{w}\right] \mathbb{P}\left[\mathbf{w}\right]}{\int_{\mathbf{w}'} \mathbb{P}\left[\mathbf{y} \mid \mathbf{X}, \mathbf{w}'\right] \mathbb{P}\left[\mathbf{w}'\right] d\mathbf{w}'} = \frac{\prod_{i=1}^{n} \sigma(y^{i} \left\langle \mathbf{w}, \mathbf{x}^{i} \right\rangle)}{\int_{\mathbf{w}'} \prod_{i=1}^{n} \sigma(y^{i} \left\langle \mathbf{w}', \mathbf{x}^{i} \right\rangle) \exp\left(\frac{-\|\mathbf{w}'\|_{2}^{2}}{2\sigma^{2}}\right) d\mathbf{w}'}$$

### Posterior Approximation

MCMC, Variational Inference, Laplace approx

### **Bayesian Logistic Regression?**

$$\mathbb{P}\left[y \mid \mathbf{x}, \mathbf{w}\right] = \sigma\left(y \left\langle \mathbf{w}, \mathbf{x} \right\rangle\right)$$
$$\mathbb{P}\left[\mathbf{w}\right] = \mathcal{N}(\mathbf{0}, \rho^2 \cdot I_d)$$

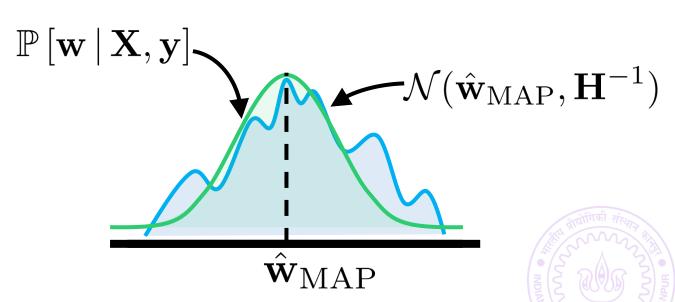

$$\mathbb{P}\left[\mathbf{w} \mid \mathbf{X}, \mathbf{y}\right] = \frac{\mathbb{P}\left[\mathbf{y} \mid \mathbf{X}, \mathbf{w}\right] \mathbb{P}\left[\mathbf{w}\right]}{\int_{\mathbf{w}'} \mathbb{P}\left[\mathbf{y} \mid \mathbf{X}, \mathbf{w}'\right] \mathbb{P}\left[\mathbf{w}'\right] d\mathbf{w}'} = \frac{\prod_{i=1}^{n} \sigma(y^{i} \left\langle \mathbf{w}, \mathbf{x}^{i} \right\rangle)}{\int_{\mathbf{w}'} \prod_{i=1}^{n} \sigma(y^{i} \left\langle \mathbf{w}', \mathbf{x}^{i} \right\rangle) \exp\left(\frac{-\|\mathbf{w}'\|_{2}^{2}}{2\sigma^{2}}\right) d\mathbf{w}'}$$

### Posterior Approximation

MCMC, Variational Inference, Laplace approx

However, even the Laplace predictive posterior is intractable  $\otimes$ 

# Multi-class and Multi-label Classification using PML

#### Multi-classification using MLE

- K > 2 classes need more detailed parameters
- For each point, its label profile is a vector

$$oldsymbol{\eta}(\mathbf{x}) =$$

$$\mathbb{P}\left[y^{i} = k \mid \mathbf{x}^{i}, \{\mathbf{w}^{l}\}_{1,...,K}\right] \propto \exp(\langle \mathbf{w}^{k}, \mathbf{x}^{i} \rangle)$$

$$\mathbb{P}\left[y^{i} = k \mid \mathbf{x}^{i}, \{\mathbf{w}^{l}\}_{1,...,K}\right] = \frac{\exp(\langle \mathbf{w}^{k}, \mathbf{x}^{i} \rangle)}{\sum_{l=1}^{K} \exp(\langle \mathbf{w}^{l}, \mathbf{x}^{i} \rangle)}$$

Likelihood function is multinomial instead of binomial

$$\mathbb{P}\left[\mathbf{y} \mid \mathbf{X}, \mathbf{w}\right] = \prod_{i=1}^{n} \hat{\boldsymbol{\eta}}_{y^{i}}^{i}(\mathbf{x}) \qquad \hat{\boldsymbol{\eta}}_{k}^{i}(\mathbf{x}) = \frac{\exp(\left\langle \mathbf{w}^{k}, \mathbf{x}^{i} \right\rangle)}{\sum_{l=1}^{K} \exp(\left\langle \mathbf{w}^{l}, \mathbf{x}^{i} \right\rangle)}$$

Softmax Regression

Binary

$$\operatorname{arg\,max} \, \mathbb{P} \left[ y \, | \, \mathbf{x} \right]$$

 $y \in \{-1,1\}$ 

Binary

$$\mathbb{P}\left[y\,|\,\mathbf{x}\right] \ge 0.5$$

Binary

$$\mathbb{P}[y \mid \mathbf{x}] \ge 0.5$$

$$\mathbb{P}[y \mid \mathbf{x}, \mathbf{w}] = \sigma(y \langle \mathbf{w}, \mathbf{x} \rangle)$$

Binary

$$\sigma(y\langle \mathbf{w}, \mathbf{x}^i \rangle) \ge 0.5$$

Binary

$$y\left\langle \mathbf{w}, \mathbf{x}^i \right\rangle \ge 0$$

Binary

$$y = \operatorname{sign}(\langle \mathbf{w}, \mathbf{x}^i \rangle)$$

$$y = \operatorname{sign}(\langle \mathbf{w}, \mathbf{x}^i \rangle)$$

$$y = \operatorname{sign}(\langle \mathbf{w}, \mathbf{x}^i \rangle)$$

$$\underset{y \in [K]}{\operatorname{arg\,max}} \, \mathbb{P}\left[y \,|\, \mathbf{x}\right]$$

Binary

$$y = \operatorname{sign}(\langle \mathbf{w}, \mathbf{x}^i \rangle)$$

$$\underset{y \in [K]}{\operatorname{arg max}} \mathbb{P} [y | \mathbf{x}]$$

$$y \in [K]$$

$$\mathbb{P} [y = k | \mathbf{x}, \mathbf{w}] = \sigma (\langle \mathbf{w}^k, \mathbf{x} \rangle)$$

Binary

$$y = \operatorname{sign}(\langle \mathbf{w}, \mathbf{x}^i \rangle)$$

$$\underset{y \in [K]}{\operatorname{arg\,max}} \sigma\left(\left\langle \mathbf{w}^k, \mathbf{x} \right\rangle\right)$$

$$y = \operatorname{sign}(\langle \mathbf{w}, \mathbf{x}^i \rangle)$$

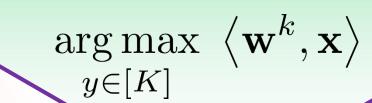

$$\underset{y \in [K]}{\operatorname{arg\,max}} \left\langle \mathbf{w}^k, \mathbf{x} \right\rangle$$

$$y = \operatorname{sign}(\langle \mathbf{w}, \mathbf{x}^i \rangle)$$

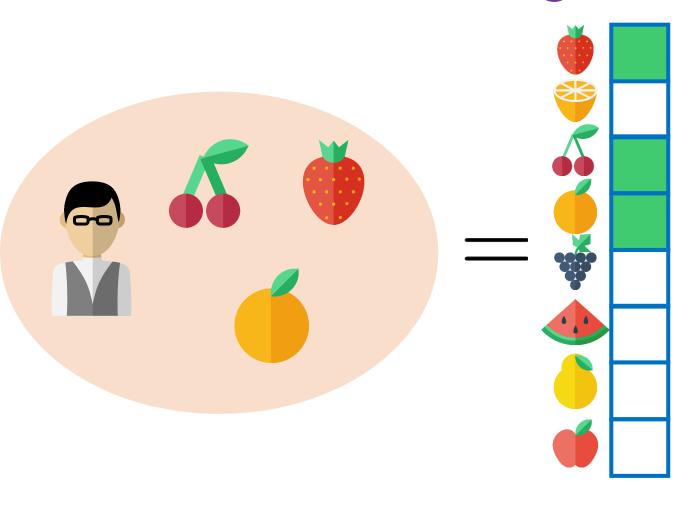

Binary

$$y = \operatorname{sign}(\langle \mathbf{w}, \mathbf{x}^i \rangle)$$

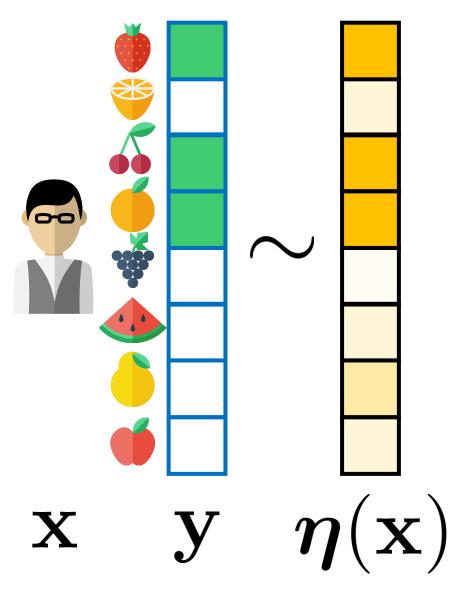

• Multiclass

$$\underset{y \in [K]}{\operatorname{arg\,max}} \left\langle \mathbf{w}^k, \mathbf{x} \right\rangle$$

Linear Classifier

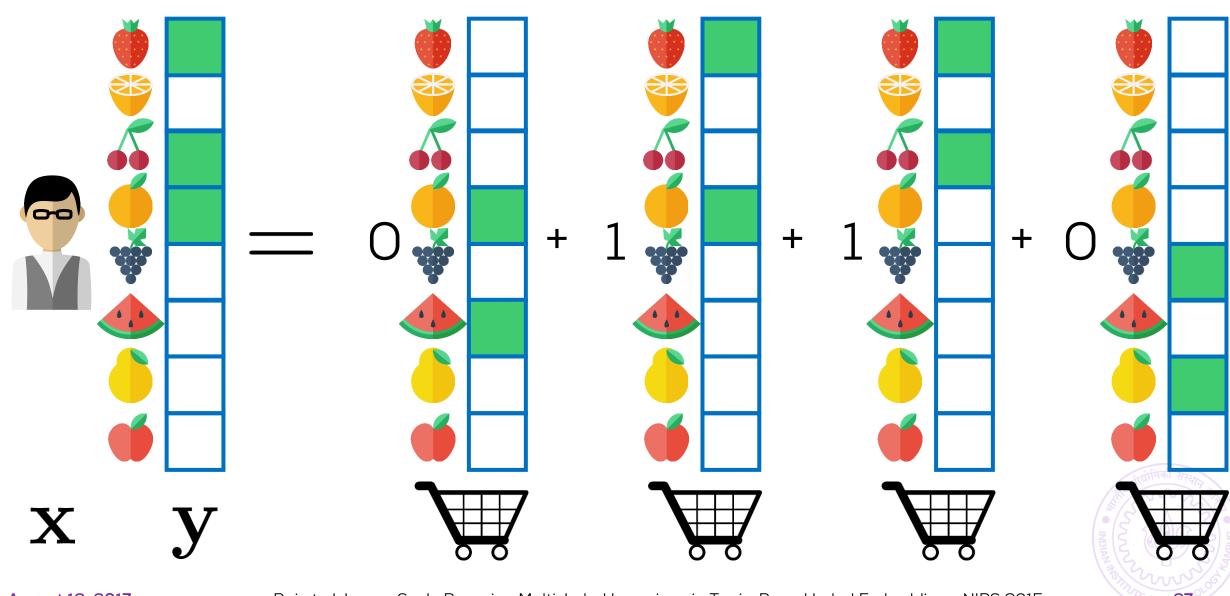

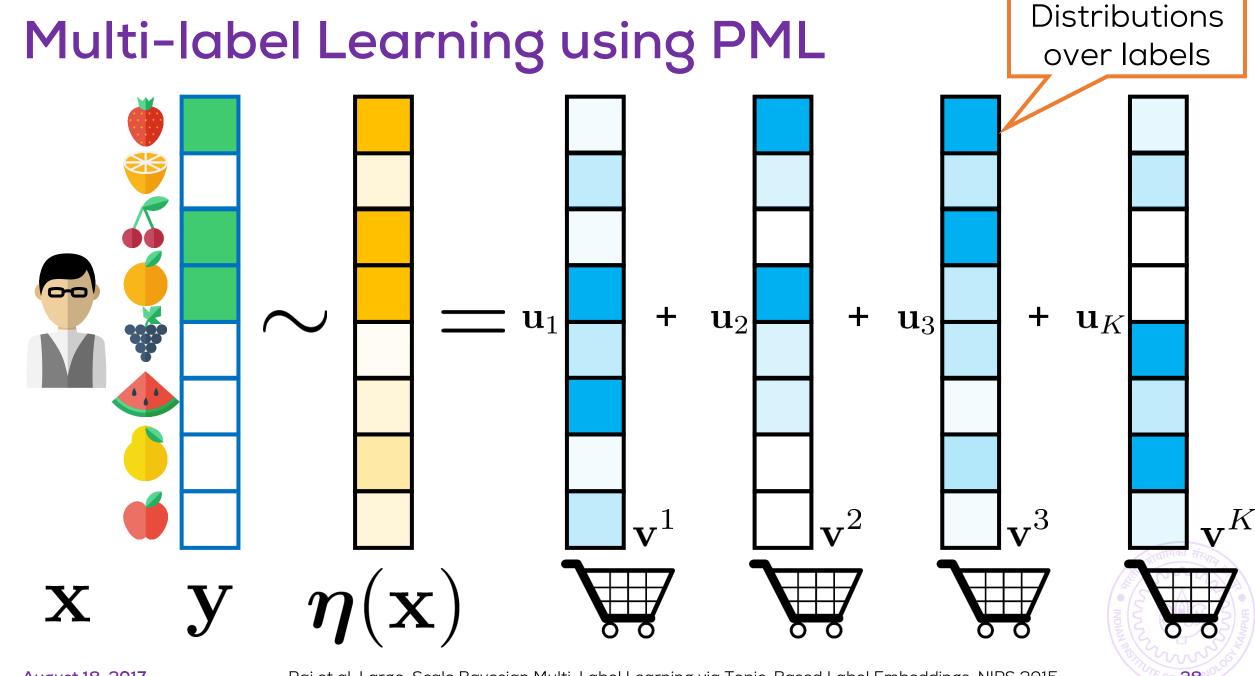

Solve as *L* independent Binary problems using Logistic regression!

Does not scale!

CS771: Intro to ML

CS771: Intro to ML

$$\mathbf{y}^{i} \sim \text{Bernoulli}(\boldsymbol{\eta}^{i})$$

$$\boldsymbol{\eta}^{i} = \mathbf{V}\mathbf{u}^{i}, \mathbf{V} = [\mathbf{v}^{1}, \mathbf{v}^{2}, \dots, \mathbf{v}^{K}]$$

$$\mathbf{u}_{j}^{i} \sim \mathcal{N}(\langle \mathbf{w}^{j}, \mathbf{x}^{i} \rangle, \sigma^{2}), j = 1, \dots, K$$

Can fix V or else ...

$$\mathbf{v}^j \sim \mathrm{Dirichlet}(oldsymbol{lpha})$$

$$\mathbf{w}^j \sim \mathcal{N}(\mathbf{0}, \rho^2 \cdot I), j = 1, \dots, K$$

Only K models, not L

Generalization of Beta distribution

$$\mathbb{P}\left[\mathbf{v};\boldsymbol{\alpha}\right] = \frac{1}{B(\boldsymbol{\alpha})} \prod_{i=1}^{L} \mathbf{v}_{i}^{\boldsymbol{\alpha}_{i}-1}$$

$$\mathbb{P}[p;\alpha,\beta] = \frac{1}{B(\alpha,\beta)} p^{\alpha-1} (1-p)^{\beta-1}$$

Have fun posterioring!
